

Starcraft

Intro

Your task is to write a program that represents an epic air battle from the famous computer game – “Starcraft”.

Two races have their large air armies ready to fight one another.

The Terran race(humans) will fight versus The Protoss race(space aliens).

Provided input

You are provided with folder called **Skeleton**, which contains:

- A header file that contains the most important information for the task.
- A Basic Skeleton to guide you in the initial direction. You don't need to strictly follow it.

You are also provided with folder called **tests**, which contains all of the tests that your program should pass.

- There are a total of 13 tests. 13 inputs and 13 outputs. The 3 of the tests are copy of the ones described in this document. The other 10 are unique.

Task description

Your task is to provide to **provide an implementation**, which with the given standard input will produce the correct standard output (detailed description below).

The **Terran** air fleet consist of 2 types of ships:

Each Terran space ship has **health** indicator. When that indicator **reaches 0** – the air ship is **immediately destroyed**.

- **Viking** – a light human space ship.
Special ability 1: does **double damage** against enemy Protoss **Phoenix** space ships.
- **Battle Cruiser** – a heavy artillery human space ship.
Special ability 1: every 5th turn the Battle Cruiser performs a special attack “Yamato Cannon”, which is **5 times more powerful** than the normal attack. The “Yamato Cannon” attack substitutes the normal attack for that turn. Example:
turns 1, 2, 3, 4 the Battle Cruiser performs normal attack and on turn 5 it uses “Yamato Cannon”.
turns 6, 7, 8, 9 the Battle Cruiser performs normal attack and on turn 10 it uses “Yamato Cannon”.

The **Protoss** air fleet:

Each Protoss air ship has **health** and **shield** indicators.

When the Protoss air ship is damaged the **shield** is first consumed. After the shield value reaches **0** the health indicator is starting to be consumed.

When the **health** indicator **reaches 0** – the air ship is **immediately destroyed**.

After each turn the protoss air ships regain some portion of their shield back. Shield indicator can **Not** exceed it's maximum value.

Example: ship has 20 health and 50 shield.

- 1) ship takes 40 damage -> left with 20 health and 10 shield.
- 2) ship regenerates 20 shield -> left with 20 health and 30 shield.
- 3) ship takes 40 damage -> left with 10 health and 0 shield
- 4) ship takes regenerates 20 shield -> left with 10 health and 20 shield
- 5) ship takes 40 damage -> left with -10 health (ship is immediately destroyed)

The **Protoss** air fleet consist of 2 ships:

- **Phoenix** – a light alien space ship.
Special ability 1: regenerates 20 shield after it's turn is finished
NOTE: after shield regeneration the shield value can **Not** exceed the ship maximum shield value.

- **Carrier** – a heavy alien space ship that attacks with **N** small weapons (called Interceptors).
Special ability 1: regenerates 40 shield after it's turn is finished
NOTE: after shield regeneration the shield value can **Not** exceed the ship maximum shield value.

Special ability 2: The Carrier attacks **N** number of times on a single turn.

N is 8 (the Carrier attacks with 8 Interceptors), when the Carrier **is at full health**. (Health, not shield)

If the Carriers **health is not at its maximum value** – **N** becomes 4 (the Carrier attacks with only 4 Interceptors)

Example:

Carrier has 150 health and 150 shield -> it attacks with 8 Interceptors

Carrier has 150 health and 50 shield -> it attacks with 8 Interceptors

Carrier has 149 health and 0 shield -> it attacks with 4 Interceptors

Carrier has 149 health and 150 shield -> it attacks with 4 Interceptors

You are given the **main()** function, which reads 2 strings (**terranFleet** and **protossFleet**).

terranFleet: consists of the letters 'v' and 'b' (for **Viking** and **BattleCruiser**).

vvbb -> would mean array of 4 air ships.

Viking with index 0, **Viking** with index 1, **BattleCruiser** with index 2, **BattleCruiser** with index 3

protossFleet: consists of the letters 'p' and 'c' (for **Phoenix** and **Carrier**).

pcpcp -> would mean array of 5 air ships.

Phoenix with index 0, **Carrier** with index 1, **Phoenix** with index 2, **Carrier** with index 3, **Phoenix** with index 4

- The air fleets take turns attacking each other.
- **First goes the Terran**, then the Protoss, then Terran, then Protoss, etc ... until one of the fleets is destroyed.
- Every time when a fleet attacks the enemy fleet it **ALWAYS TARGETS THE LAST SHIP** (until that ship is dead). When the ship is dead it should be **immediately removed from the air**

ship array and then the **next last ship should be targeted**.

Example: Terran fleet is: **vvb**

The protoss army will attack only the **BattleCruser** with **Index 2** until that ship is dead. Once it is dead it should be **removed** from the terran air fleet array. The array is left with only 2 Viking ships.

Protoss will start to attack **Viking** with **index 1**.

- Keep in mind that the Carrier ship attacks multiple times per single turn. If the Carrier happens to kill an enemy ship and still has shots left (Interceptors that have not fired) they are used on the next ship(if such exists).
- In the perfect case scenario you should have multiple files for each individual air ship.

Console output

- When a ship destroys an enemy ship you should **print**
ShipName with ID: *ShipId* killed enemy airship with ID: "enemyShipID" (where *ShipName* is Viking, BattleCruser, Phoenix or Carrier)
and a newline
- In the end of a **Terran** turn you should make a **print**
Last Protoss AirShip with ID: *ShipId* has *shipHealth* left and *shildShield* left
and a newline
- In the end of a **Protoss** turn you should make a **print**
Last Terran AirShip with ID: *ShipId* has *shipHealth* left
and a newline

Restrictions

Code should compile under the C 11 standard.

Code should not use any non-standard extensions.

Examples

Input	Output
vv pp	Last Protoss AirShip with ID: 1 has 90 health and 30 shield left Last Terran AirShip with ID: 1 has 110 health left Last Protoss AirShip with ID: 1 has 80 health and 0 shield left Last Terran AirShip with ID: 1 has 70 health left Last Protoss AirShip with ID: 1 has 40 health and 0 shield left Last Terran AirShip with ID: 1 has 30 health left Viking with ID: 1 killed enemy airship with ID: 1 Last Protoss AirShip with ID: 0 has 90 health and 90 shield left Last Terran AirShip with ID: 1 has 10 health left Last Protoss AirShip with ID: 0 has 90 health and 30 shield left Phoenix with ID: 0 killed enemy airship with ID: 1 Last Terran AirShip with ID: 0 has 150 health left
